Most ESRD\textsuperscript{1} and CKD\textsuperscript{2} patients are 25-hydroxyvitamin D deficient or insufficient. -

*Treatment with an active vitamin D analogue does not resolve 25 (OH) D deficiency.* -

Low 25(OH) D levels are associated with:

- Cardiovascular disease \textsuperscript{3}
- Secondary hyperparathyroidism \textsuperscript{4}
- Insulin resistance \textsuperscript{5}
- Metabolic Syndrome \textsuperscript{6}

KDOQI\textsuperscript{™} recommends treatment of vitamin D deficiency starting with CKD stage 3.

One Vital-D Rx\textsuperscript{™} per day provides KDOQI’s recommendation of 50,000 IU per month.

Vital-D Rx\textsuperscript{™} is the only CKD/ESRD vitamin with zinc and 1750 IU cholecalciferol (D\textsubscript{3}).
